

Grid Authenticator - Pattern-based Authentication

Brand: Gemalto

Product Code: SMASN602

Short Description

Tokenless technology enables any user to be authenticated anytime and anywhere. Context-based authentication offers convenient, frictionless strong authentication while maintaining the flexibility and agility to add protection with stronger methods of security in higher risk situations. Combined with "step-up" authentication, context-based authentication optimizes a layered approach to access security by assessing user login attributes and matching them against pre-defined security policies.

Description

Pattern-based, also called GrIDSure Authentication is a convenient pattern-based authentication solution that overcomes the weakness of passwords without the need for software to be installed or hardware to be provisioned.

Pattern-based Authentication works by presenting the user with a matrix of cells during enrollment containing random characters, from which the user selects a Personal Identification Pattern (PIP). Every time the challenge grid appears, the characters in the cells are different, so the user is always entering a one-time passcode.
